BENTONITE DAL CIN, FEED ADDITIVE BENTONITE (E558)

Dal Cin company has been dealing with bentonite since 1949. The industrial processes developed by Dal Cin in their plants use pure raw bentonites of European mines. The quality of the material allows to decide the proper working process and reach the best results in terms of activity and application.

We supply a range of high quality **Bentonite** specific for feed industry (**additive E558**) characterized by high degree of montmorillonite and low content of heavy metals like cadmium, lead and dioxins (Reg. UE 574/2011).

It's ordinary practice to add bentonite to feed for many well-established advantages.

Technological advantages

1. the bentonite in manufacturing pellets (rate 1-2%) allows to homogenize and give cohesion to the feed component for its strong binding action.
2. Bentonite is the best natural aggregating agent to manufacture pellet in feed industry.
3. the equipment to draw the pellet is less subjected to abrasion and stress.

Advantages on animal feeding

1. better assimilation of the nutrients for a persistent presence of feed into the digestive system.
2. positive influence on the inner fermentation and enhanced bio-availability in the digestive tract of the animal of the inorganic nitrogen.
3. very great effect in binding and removing the mycotoxins for the strong ability of bentonite in absorb them on its surface.
